# Finding a maximal subgroup of minimal index in polynomial time

Savelii Skresanov

Novosibirsk State University

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

# Motivation

Graph = a finite undirected graph without loops or multiple edges.

We say that a representation of a group G on a graph  $\Gamma$  is a homomorphism from G to  $Aut(\Gamma)$ .

Notice that there always exists a trivial representation sending all elements of G to  $id_{\Gamma}$ .

# Motivation

Graph = a finite undirected graph without loops or multiple edges.

We say that a representation of a group G on a graph  $\Gamma$  is a homomorphism from G to  $Aut(\Gamma)$ .

Notice that there always exists a trivial representation sending all elements of G to  $id_{\Gamma}$ .

#### Example

 $Sym_4$  has a nontrivial representation on • • •

Alt<sub>4</sub> has no nontrivial reprs. on  $\bullet$ , but has one on  $\land$ 

#### Group representability problem

Given a group G by its multiplication table and a graph  $\Gamma$  by adjacency matrix, determine whether there exists a nontrivial representation of G on  $\Gamma$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Theorem (Dutta and Kurur, 2009)

Graph isomorphism problem is reducible to the group representability problem for groups of the form  $C_p$ , where p is a prime.

Tree isomorphism can be decided in linear time.

# Theorem (Dutta and Kurur, 2009)

The group representability problem on trees is equivalent to the problem of testing, given an integer n and a group G, whether there exists a nontrivial homomorphism from G to  $Sym_n$ .

The latter problem is called permutation representability problem and it is equivalent to finding the smallest integer n, such that

$$\exists \phi: \mathbf{G} \to \mathbf{Sym}_n, \, \phi \not\equiv 1$$

Denote by  $\kappa(G)$  the smallest possible degree of a nontrivial permutation representation of G.

Such a representation is primitive.

In other words:

 $\kappa(G) = \min\{|G:M| \mid M \text{ is maximal in } G\}.$ 

To recap:

## Group representability on trees (Does G act on a tree?) $\bigcirc$ Permutation representability problem (Does G act on d points?) $\bigcirc$ Computing $\kappa(G)$ (What is the smallest |G:M| for M < G?)

Dutta and Kurur write: "... the group representability problem over trees is equivalent to permutation representability problem, a problem for which, we believe, there is no polynomial time algorithm".

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Dutta and Kurur write: "... the group representability problem over trees is equivalent to permutation representability problem, a problem for which, we believe, there is no polynomial time algorithm".

Theorem  $\kappa(G)$  can be computed in time polynomial in |G|.

## Corollary

Group representability on trees can be decided in polynomial time.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The algorithm substantially relies on CFSG.

# Algorithm outline

On each step we select two minimal normal subgroups.

Theorem (Burness, Liebeck, Shalev, 2013)

Maximal subgroups of almost simple groups are 6-generated.

Height of the tree is  $\leq \log_2 |G| \Rightarrow$  running time  $\sim |G|^{11}$ .

There are two main obstacles in applying this algorithm to permutation groups:

- ► Traversing the tree of quotients (having to look at 2<sup>log<sub>2</sub>|G|</sup> = |G| in the worst case)
- Generating maximal subgroups in the almost simple case (trying |G|<sup>6</sup> tuples)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

There are two main obstacles in applying this algorithm to permutation groups:

- ► Traversing the tree of quotients (having to look at 2<sup>log<sub>2</sub>|G|</sup> = |G| in the worst case)
- Generating maximal subgroups in the almost simple case (trying |G|<sup>6</sup> tuples)

Both can be overcome.

#### Lemma

Let  $S < G \le Aut(S)$ , where S is a nonabelian simple group, and pick  $H \le G$  with  $|G:H| = \kappa(G)$ . Then  $S \le H$ .

The proof relies on Schreier's hypothesis.

Denote by  $core_G(H) = \bigcap_{g \in G} H^g$ .

Theorem

Let H be a subgroup of minimal index in G. Then  $G/core_G(H)$  is a simple group.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Denote by  $core_G(H) = \bigcap_{g \in G} H^g$ .

#### Theorem

Let H be a subgroup of minimal index in G. Then  $G/core_G(H)$  is a simple group.

# Corollary

Let G be a permutation group. Then  $\kappa(G)$  can be computed in polynomial time.

## Proof.

Find all simple quotients G/N and compute  $\kappa(G/N)$  by using the description of minimal permutation representations of simple groups.

# Some questions

- Are there any applications besides group representability on trees?
- What about group representability on other classes of graphs with controllable automorphism group? (planar graphs, for example)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# A final remark

Recall the main result:

Theorem

Let H be a subgroup of minimal index in G. Then  $G/core_G(H)$  is a simple group.

Compare with these:

# Proposition 1

Let p be a smallest prime dividing |G|. If  $H \leq G$  and |G: H| = p, then  $H \trianglelefteq G$ .

## Proposition 2

Let  $f = \min\{\chi(1) \mid \chi \in Irr(G), \chi(1) > 1\}$ . If  $H \leq G$  and  $|G:H| \leq f$ , then  $H \leq G$ .
